

The **ABC MapMaker** application is a windows program to retrieve map data from internet servers, such as Open Street Map, or Google Maps.

Automated geo-referencing allows for direct import into ABC's **4T2™ RF-Analyser** application to measure the transmitter coverage area.

The software loads map-tiles of a mouse-selectable region in a batch process and combines them into a single map file.

fields of use

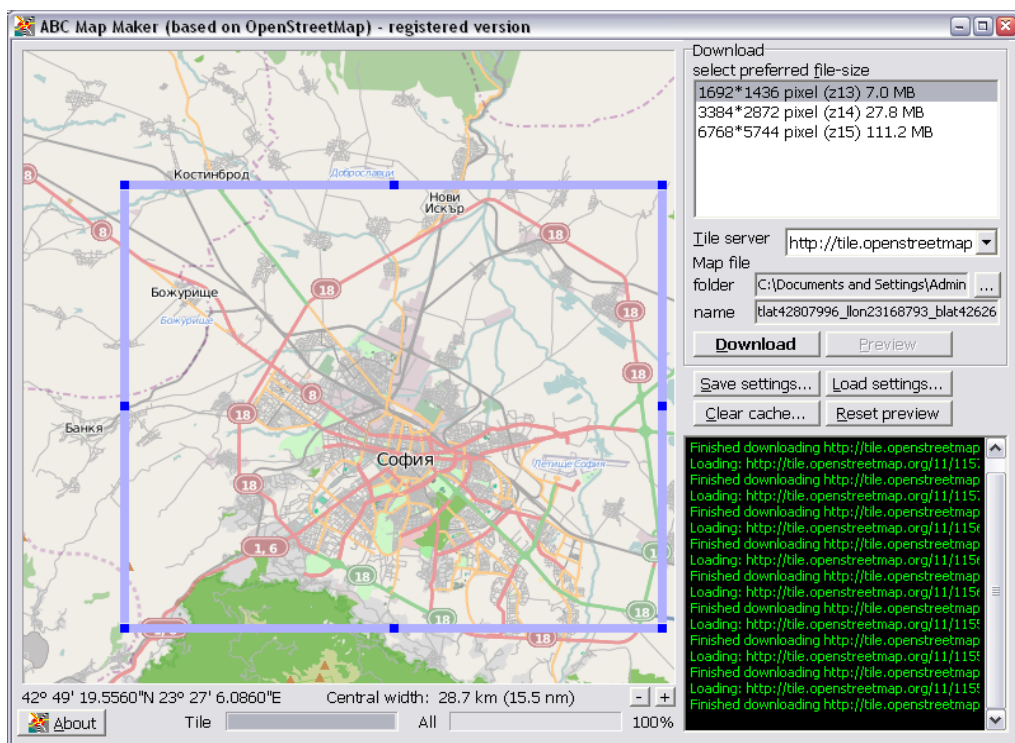

- Retrieval of Map Files for use with **4T2™ RF-Analyser** Coverage Analysis feature

benefits

- Easy-to-use application to obtain geo-referenced map data at no extra cost
- Off-line map availability
- Download-resolution adjustable

characteristics

- Open Street Map, and Google Maps application available
- 1 mega-pixel to 67 mega-pixel resolutions
- Supporting 64bit Windows®
